Time Series Analysis

- This website is built around my lecture slides, with the broader course narrative woven around them so that the site also serves as a self-contained reference for the module.
- Throughout, you'll find signposts to textbooks, animations, live R graphs, audio snippets, and other resources where relevant.
- If there's a specific concept you'd like more support with, let me know. The syllabus is fixed, but I'm happy to add the occasional supplementary materials like an audio snippet or a screen recording to explain a given topic a little more.

Topic 01

Introducing Time Series Analysis

Core statistical foundations, what time series analysis is, and why it needs special techniques.

[Read notes → PDF ↓](#)

Topic 02

Introducing ARMA(p, q) models

White noise, MA and AR building blocks, the lag operator, and the full ARMA(p, q) family.

[Read notes → PDF ↓](#)

Topic 03

Measuring dependence

Autocovariance and autocorrelation functions — how we quantify dependence across time.

[Read notes → PDF ↓](#)

Topic 04

Defining stationarity

Strong and weak stationarity, and the autocovariance structure of stationary series.
